# Minigrids- Are We Serious?

Glenn Platt  
CSIRO Energy Technology  
Australia

Newcastle

Sydney

# CSIRO work on Minigrids

- Microgrid planning tools using GA
- Microgrid dynamic systems modelling & control
- Load demand forecasting using AI
- Demand side management
- Intelligent sensor networks

GA - Genetic Algorithms

AI - Artificial Intelligence

HVAC - Heating, Ventilation and Air Conditioning

# Distributed Generation Grid

TIER 3

3 x 20kW Wind Turbine

90kW Solar PV

2 x 60kW Gas Turbine

## APP Minigrid

TIER 2

1kW Vertical Axis Wind Turbine

30kW Gas Turbine

23kW Solar PV

64kW Test Load Bank

Minigrid Control Room

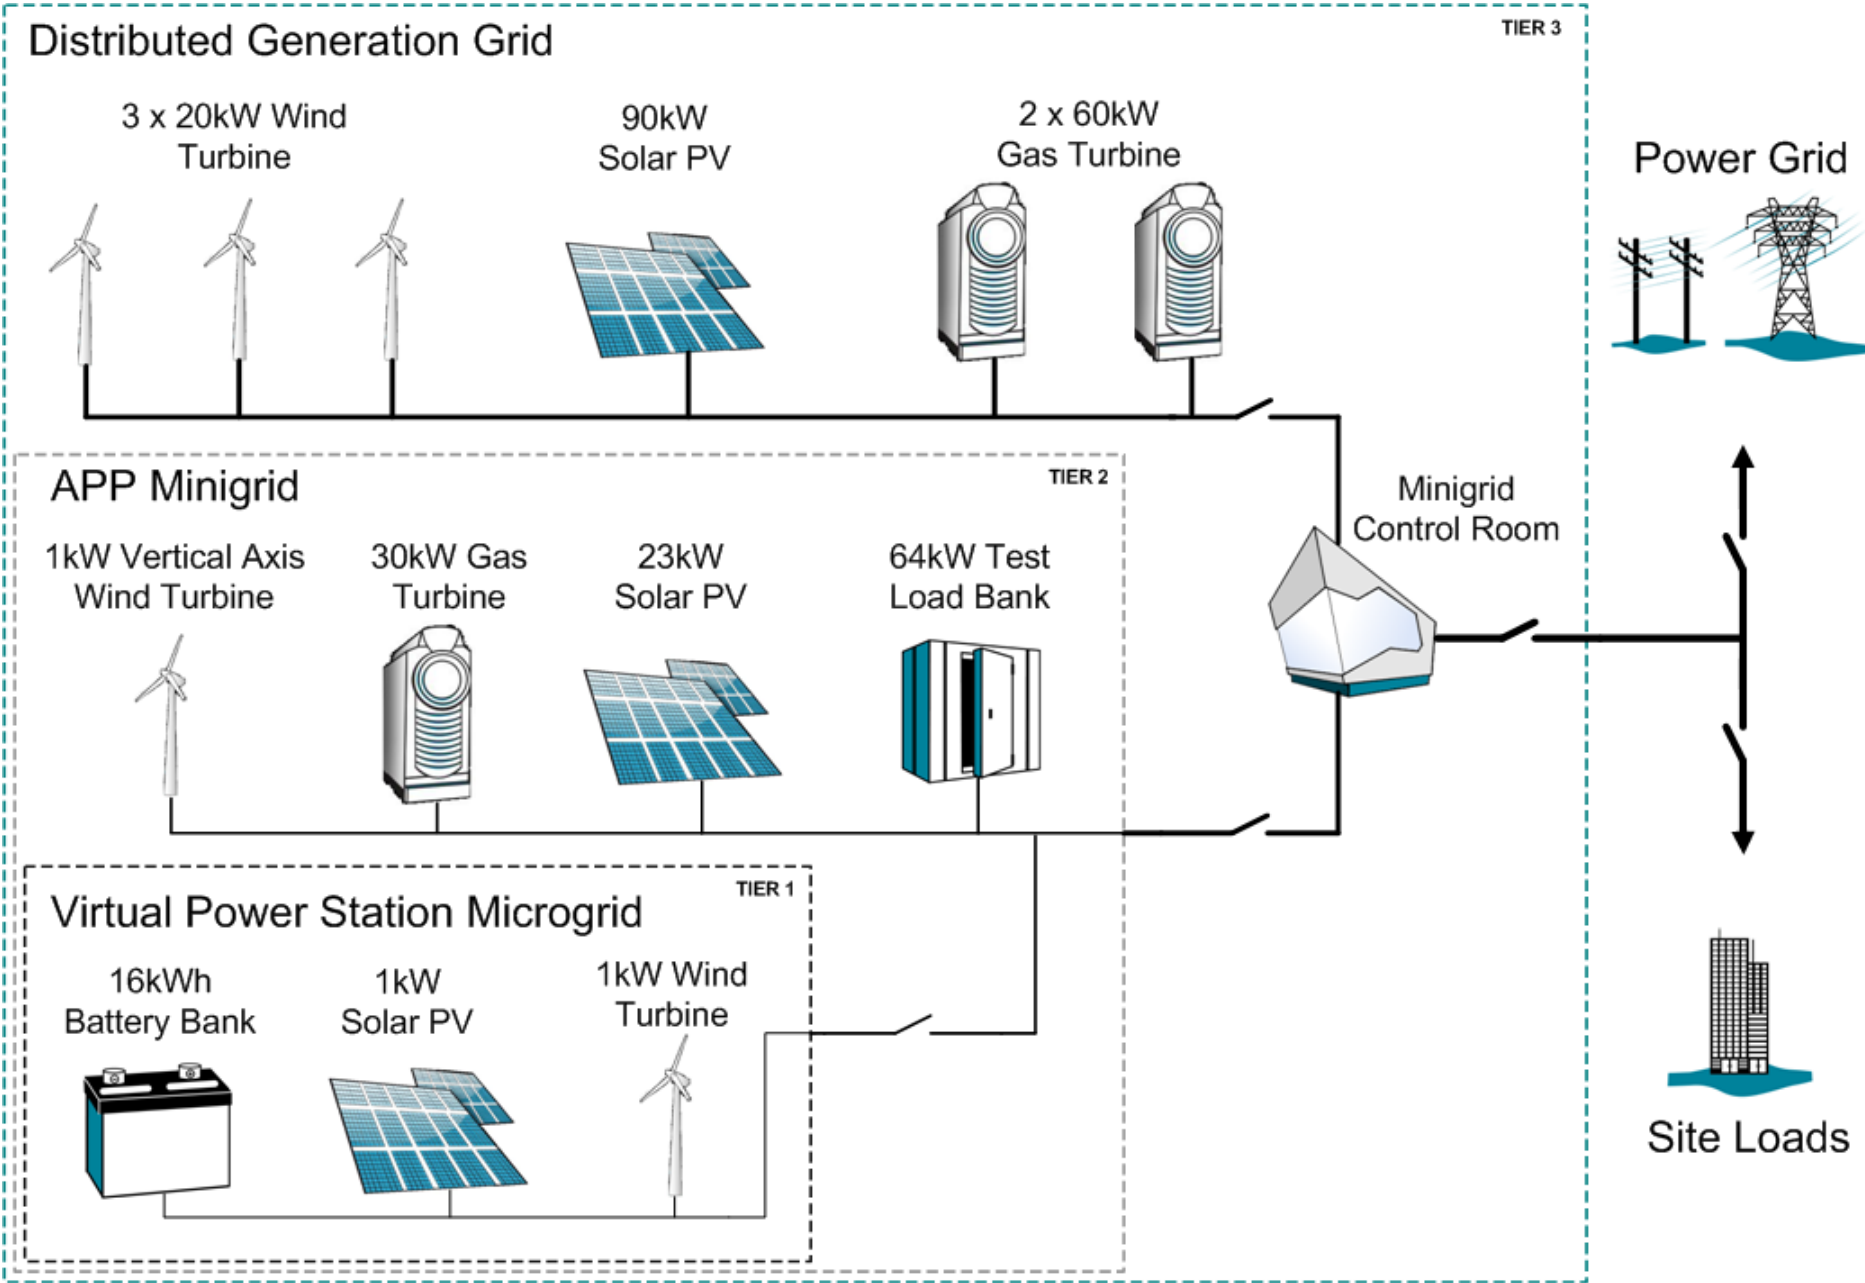

## Virtual Power Station Microgrid

TIER 1

16kWh Battery Bank

1kW Solar PV

1kW Wind Turbine

# Current Work

- **Islanding with minimal storage**
  - No reciprocating engine
  - Multiple power electronics
  - Inverters *evolve* control
- **Sensor minimal fault detection**
- **Generation & load forecasting then matching**
  - Black box learning
  - Multi agent coordination

## Background

“The world is not on course  
to achieve a sustainable  
future”

- Intergovernmental Panel on Climate Change (IPCC) (Working Group Three), Climate Change 2007 - Mitigation. 2007, IPCC

## Background

A single cascading blackout in the United States left fifty million people “surviving in a darkened, dangerous, hobbled economy”

- C. Marnay and O. C. Bailey, The CERTS Microgrid and the Future of the Macrogrid, in ACEEE Summer Study on Energy Efficiency in Buildings. 2004: Pacific Grove, California.

The supreme engineering achievement of the 20th century is aging, inefficient and congested, and incapable of meeting... future energy needs... without operational changes and substantial capital investment”

- United States Department of Energy, Grid 2030: A National Vision for Electricity's Second 100 Years. 2003, United States Department of Energy - Office of Electric Transmission & Distribution: Washington.

# Planning of Minigrids

- Many options, and some are competing:
  - Choice of generation types
  - Choice of unit size
  - Placement of generation units
  - Amount and type of storage
- Many measures of success:
  - Reduce installation cost
  - Reduce CO<sub>2</sub> emissions
  - Reduce electrical line losses
  - Maximize waste heat usage

# What is the solution?

- Artificial intelligence techniques:
- Optimization Types
  - Particle Swarm Optimization
  - Fuzzy Systems
  - Evolutionary Algorithms
  - Simulated Annealing

# What is wrong with these solutions?

- A lack of easily accessible tabulated results
- Details of real-world load and generator details
- An absence of well-defined test problems
- Insufficient knowledge of contemporary comparative metrics
- A lack of standards for communication of problems and results

# What is wrong with these solutions?

- **Contemporary studies have:**
  - failed to explore a diverse set of problems
  - lack analytical rigour
  - offer scant comparison between approaches
  - often fail to use models based on real-world loads or generators

# DG-PAST-SAT (Distributed Generator Placement and Sizing Test Suite and Analysis Tool)

- Distribution network topologies
- Load characteristics and profiles based on real donated data
- First unified collection of such problem components
- Example problems - effects of load intensity and position, generator availability and size, network topology, line impedance and waste heat use

# DG-PAST-SAT (Distributed Generator Placement and Sizing Test Suite and Analysis Tool)

- Problem visualization
- All elements XML specified, with full schemas available
- Dynamic repository - enables creation and sharing of new resources and performance results

# Conclusion

- **Studies thus far lack:**
  - Commonality in problem sets
  - Sufficient comparison between differing approaches
  - Realistic systems
- **Our free software tool includes:**
  - Standard models for plant
  - A variety of problems
  - Comprehensive analysis utilities
  - Uploadable extension
- **Lets work together here**
